To ensure the quality of food product, consumers have the information expressed on food labels, and use of this tool can provide a choice for healthier foods. The consumption of dietetic products has grown in the last years, as well as the search for nutritional information about these products. With this in view, this study aimed to evaluate the nutritional information of dietetic products commercialized in Cuiabá, Mato Grosso, Brazil, according to Brazilian legislation for labeling of packaged foods. Twelve dietetic products samples were evaluated from a checklist based on the Resolution RDC n°. 259/02 and 360/2003 of National Health Surveillance Agency. The results indicate unconformities in all the marks evaluated. In the solid sweeteners were detected the absence of the simplified declaration of nutrition information and not rounding of values related to energy and carbohydrate content. For liquid sweeteners, the marks had not evaluated the method of preservation, storage and product registration. For solid refreshments were observed poor visibility in the expiration date, list of ingredients and product registration, as well as errors in calculation of the reference daily intake for the folic acid and the home measure. Due to the increased consumption of dietary products, it is necessary to improve monitoring of information on the labels in order to ensure food quality and safety of the population. It also emphasizes the need for the standardization of the units of household measure, with the objective of facilitates understanding of the consumer in the preparation of the product.
