Kitchen furnishings and utensils should be arranged to make cleaning easier, minimize the accumulation of leftover food and avoid the emergence of urban pests. The purpose of this study was to evaluate the conditions of conservation and hygiene of kitchen furnishings and utensils. The study was carried out in 300 households, with direct observation if furnishings and utensils were in conformity or not with the legislation. Statistical analysis was performed by the software SAS, with significance level of 5%. It was observed that the urban area had a regular rate (61.1%) and rural area had an excellent rate (94.3%) in relation to the arrangement of utensils. If the kitchen utensils were in a good working order, it was registered that both urban and rural areas were classified as good. In the case of quality of kitchen furnishings, it was observed that the urban area (68.4%) and rural (62.3%) were classified as regular. The hygiene of furnishings and utensils, in urban areas (60.0%) and in rural (58.5%) were classified as regular, having statistically significant differences. So, it was concluded that residential kitchens surveyed had a regular hygienic and sanitary conditions, which may cause potential contamination events.
